Dashboard – Issues & Improvements

Overview

I explored the CometChat Dashboard after creating the app. The overall experience was smooth, but a few things could be improved for better clarity and ease of use.

The observation is that a search box allows users to easily find options if they cannot find them readily, which would be very helpful.

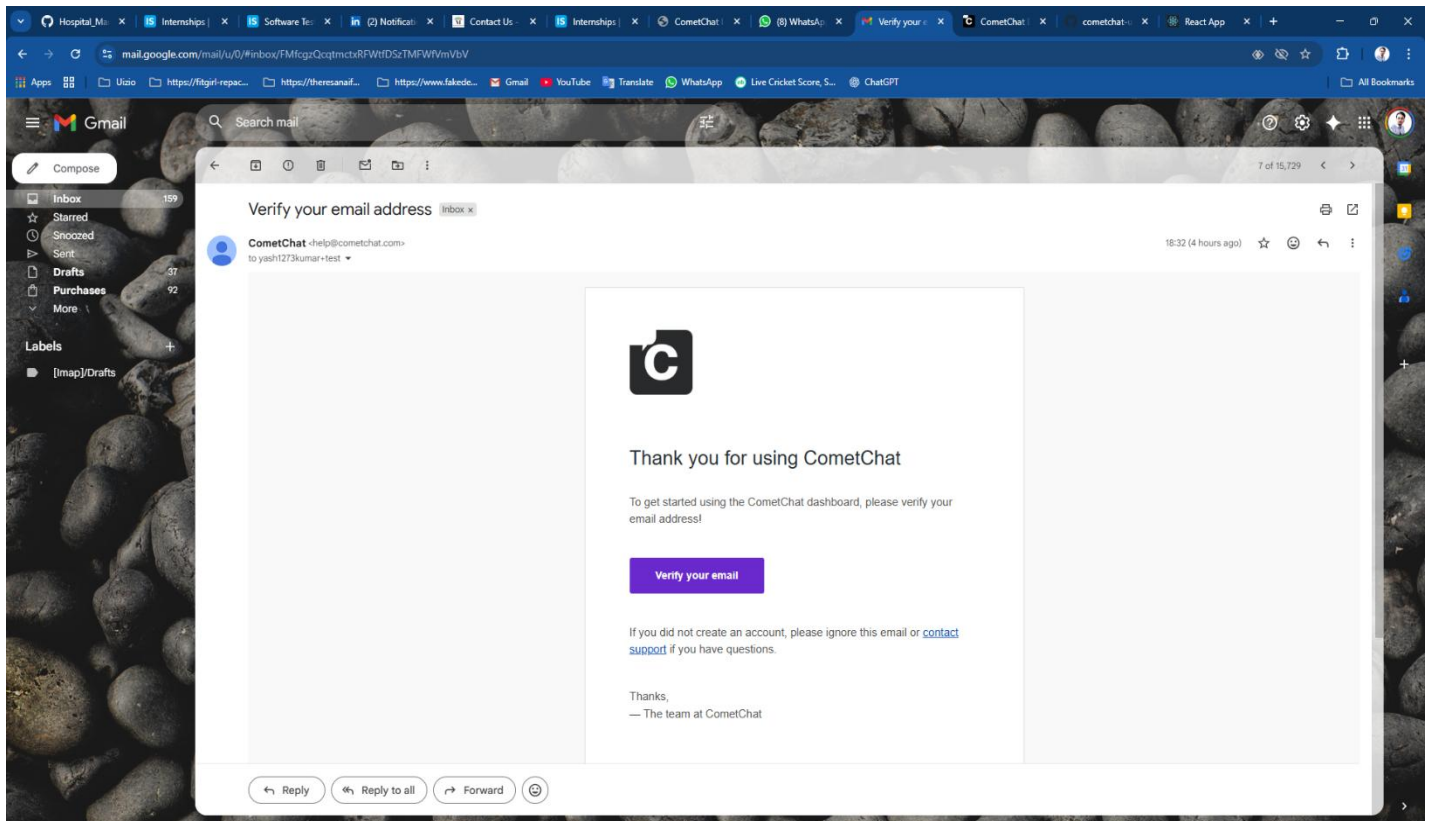

1. Expected vs Actual

◆ Expected

- The dashboard should clearly show all important sections like:
 - App Overview
 - Users
 - UI Kit Builder (Sample Apps)
- All buttons and pages should load quickly.
- New users should easily understand where to start.

◆ Actual

For a new user bit hard to make account OTP should come on Gmail do not send the verify mail.

Create Application

Provide a details about your app to help us configure it correctly

Application Name

YashTestApp

Industry

Online Education

Region ⓘ

US

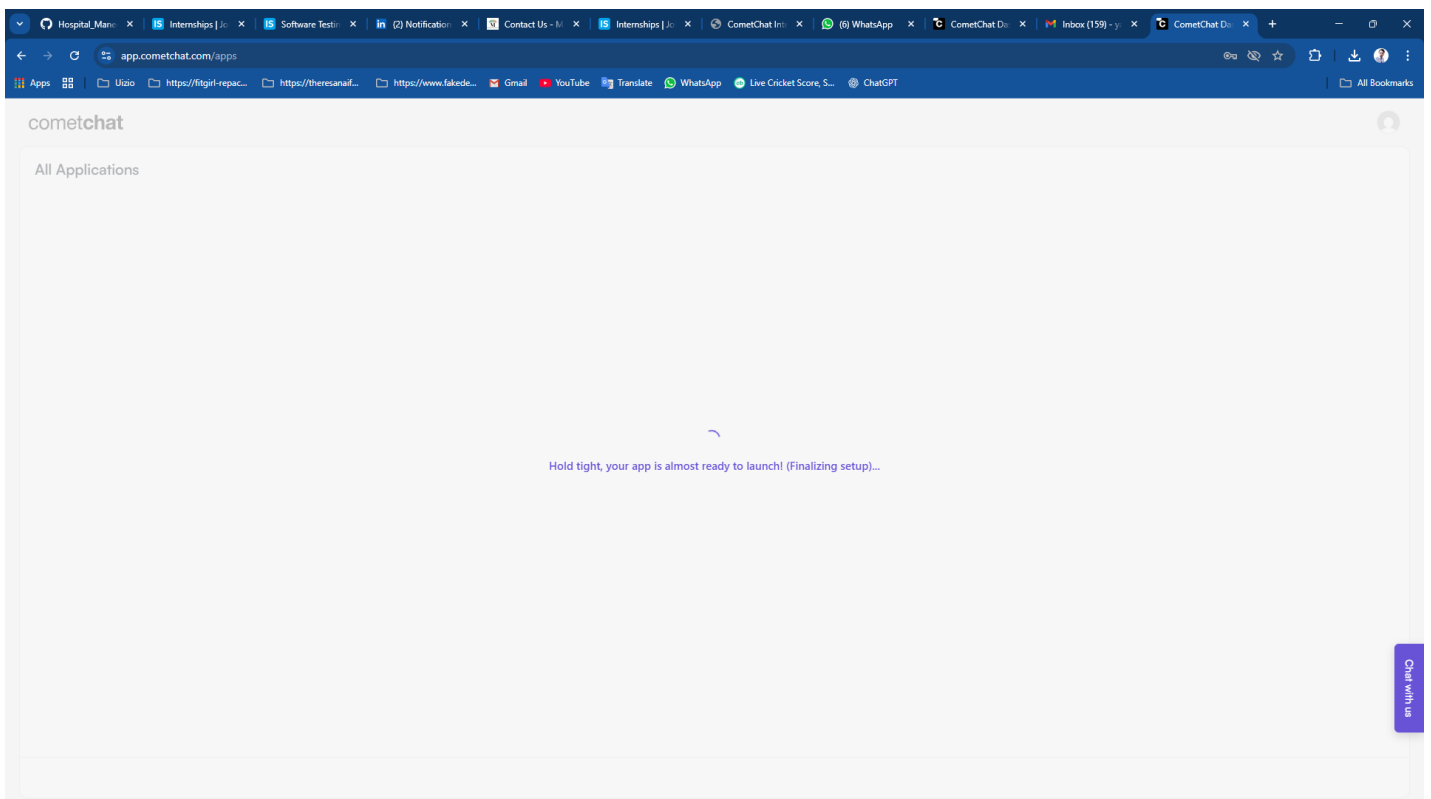

EU

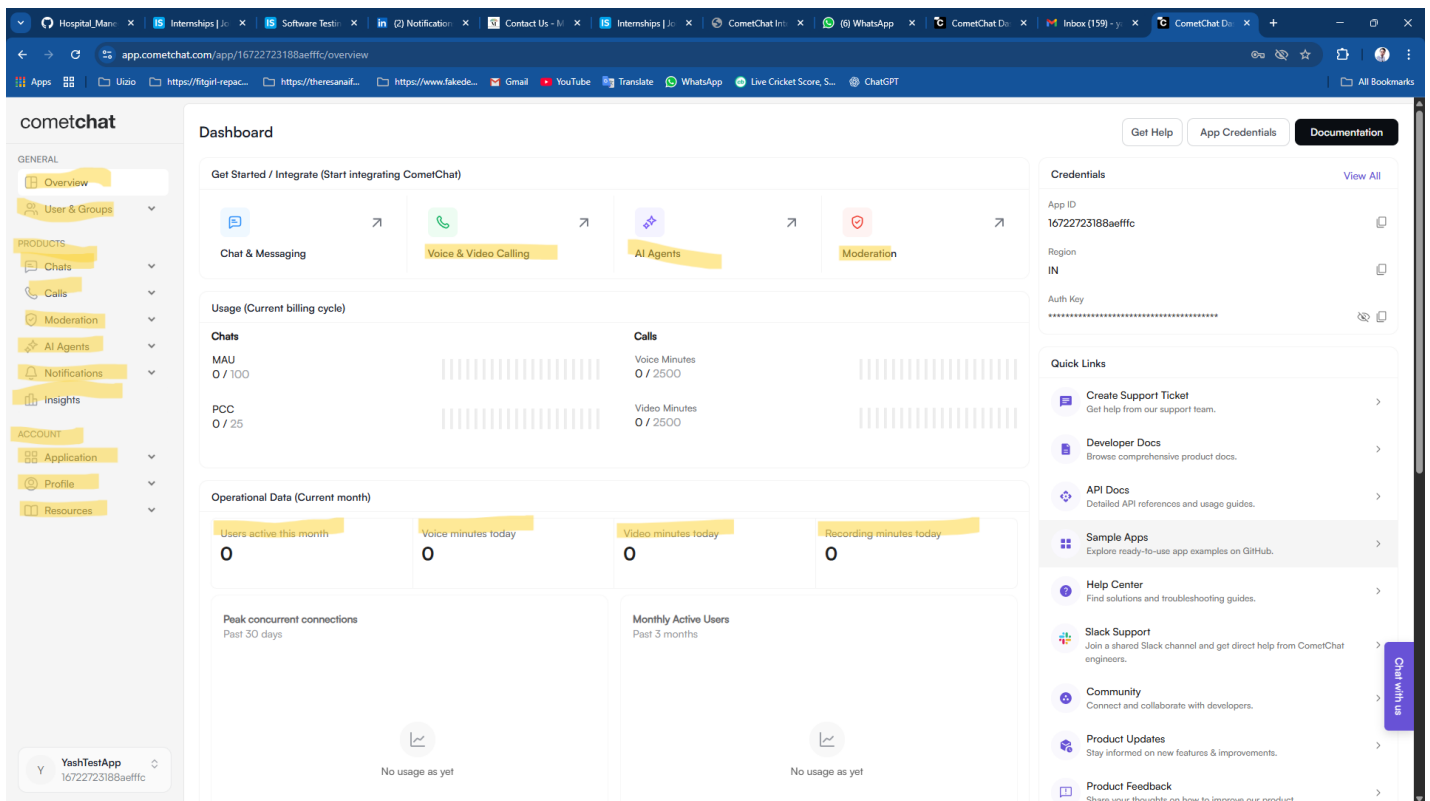

IN

Continue

- The dashboard UI was clean, but a bit overwhelming at first because there are many tabs. So it takes time to understand when create the app

- Some sections are not clearly highlighted, like the left side options and all the necessary options,

- A new user may not understand which settings are required to run the UI Kit.

2. Friction Points

- No clear “Start Here” guide for beginners.
- The UI Kit Builder button is visible, but not immediately obvious for first-time users.
- Some pages load with a slight delay.

3. Bugs or Errors

- No major bugs found.
- No broken links noticed during navigation.

4. Missing or Unclear Steps

- The dashboard does not explain:
 - Where to add the App ID and Auth Key inside the generated project.
- A short setup checklist would be helpful for new developers.

5. Suggestions for Improvement

- Add a “**Getting Started for New Developers**” banner on the dashboard.
- Highlight important keys (App ID, Region, Auth Key) with better guidance.
- Add more tooltips to explain what each section does readily.
- Provide a setup wizard that guides step-by-step for first-time users.

UI Kit Builder – Issues & Improvements

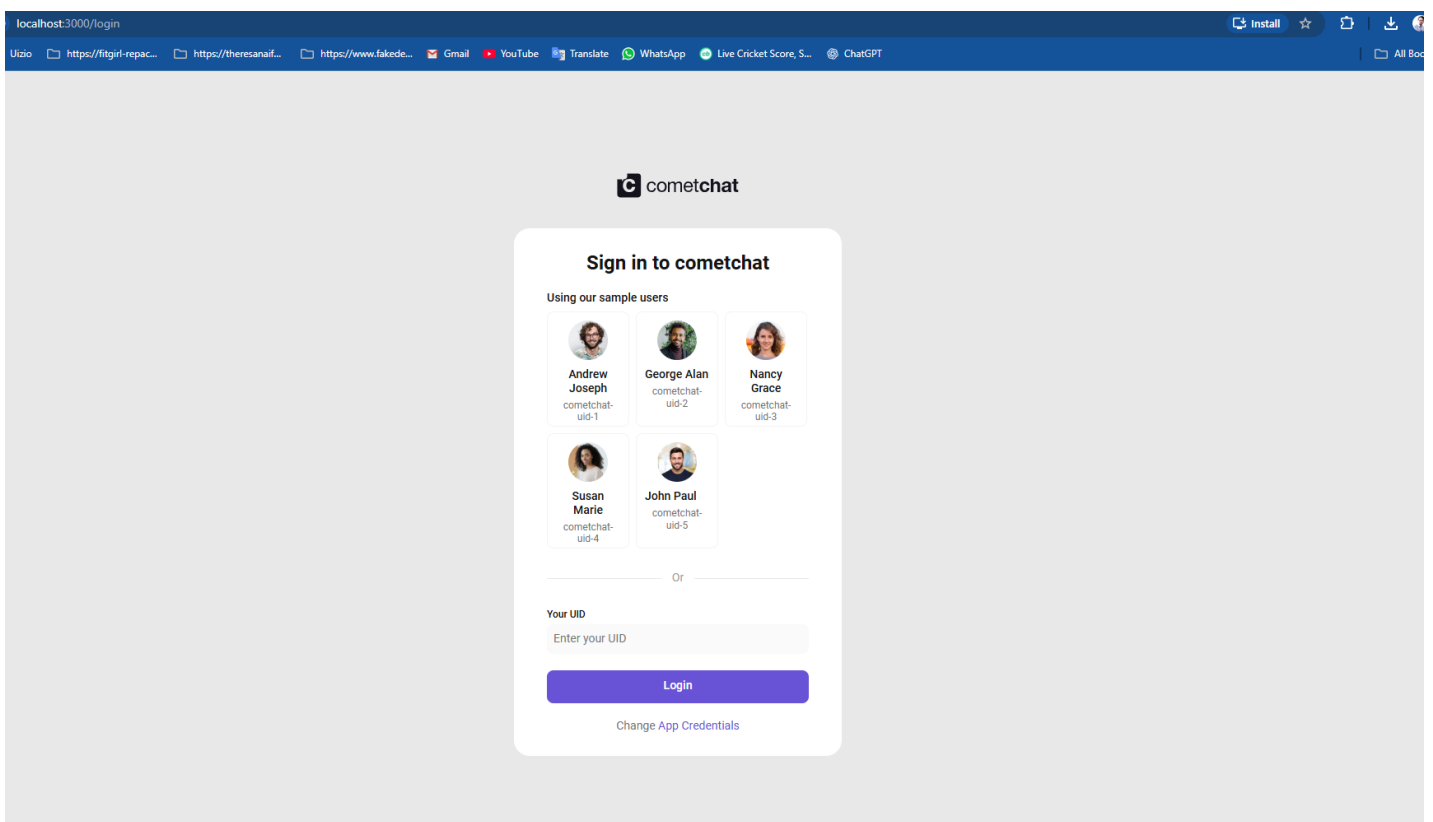

Overview

I used the CometChat UI Kit Builder to generate the React project. The tool worked well, but there were a few areas where the experience could be smoother for new users.

1. Expected vs Actual

◆ Expected

- The UI Kit Builder should clearly show:
 - Themes
 - Components
 - Features

- The preview should update quickly when changes are made.
- The download process should be straightforward.
- It should be clear which steps are required to generate a working project.

◆ Actual

- The UI Kit Builder interface was simple, but:
 - Some options were not clearly explained.
- The preview sometimes updated slowly.
- There was no confirmation message explaining what to do after downloading.

2. Friction Points

- No clear instructions on:
 - What each feature means (e.g., calling, groups, chat widgets).
 - Which components are optional or required?
- The interface expects users to already know CometChat features.
- The preview doesn't always reflect all customizations instantly.

3. Bugs or Errors

- **No major bugs found.**
- No broken UI elements.
- The preview panel sometimes took extra seconds to refresh.

4. Missing or Unclear Steps

- The builder does not mention:
 - Which file contains the App ID and Auth Key.

5. Suggestions for Improvement

- Highlight the **Download** button or add a final summary step.
- Show a pop-up after download with:
 - Setup instructions
 - Commands to run the project
 - Where to add API keys

Documentation – Issues & Improvements

Overview

While setting up CometChat using the official documentation, I noticed several areas where a new developer may feel confused. The documentation is good overall, but some steps are unclear or incomplete.

1. Expected vs Actual

◆ Expected

- Clear setup steps
- Proper explanations for each option
- React-specific instructions
- Troubleshooting guidance

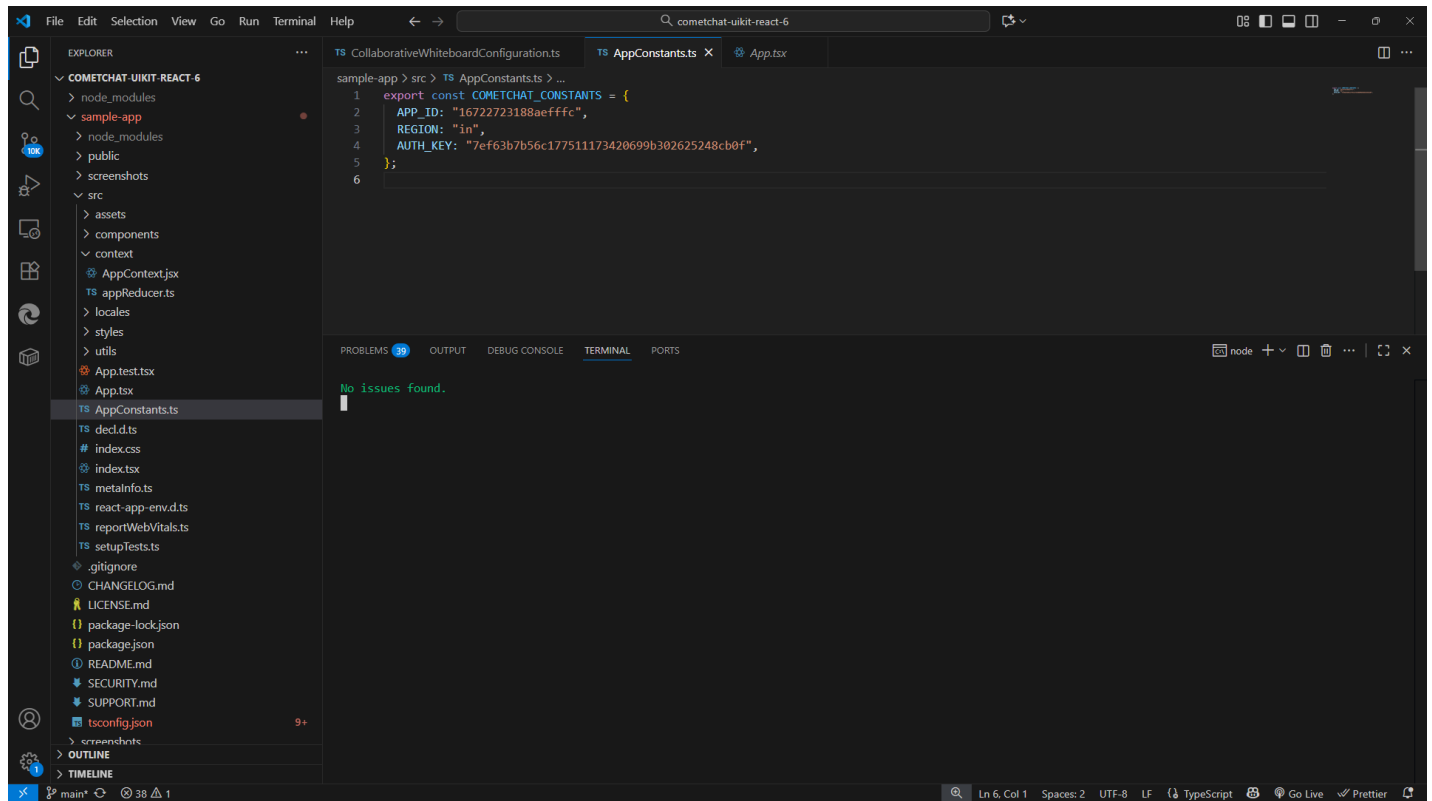

◆ Actual

- Documentation is detailed, but:

- Some pages are too long and difficult to follow.
- Important steps (like initialization, authentication, extensions) are spread across multiple pages.
- Some sections assume prior CometChat knowledge.

2. Friction Points

- Hard to understand where the **UIKitSettings** must be added.

- No direct explanation of what each builder function does.
- Calling extension documentation is missing or outdated.
- Login examples are not beginner friendly.

3. Missing or Unclear Steps

a) UI Kit Setup

- Documentation does not show where to place:
 - UIKitSettings
 - UIKitSettingsBuilder
 - Extensions like calling or stickers

b) Authentication

- Not clearly explained:
 - When to call CometChat.init()
 - When to call CometChat.login()
 - Where AppID and AuthKey should be stored

c) Calling Feature

- No proper React examples.
- No step-by-step “how calling works.”

d) Theme Customization

- Documentation only shows small parts, not a complete example.
- No clear list of all theme variables.

4. Bugs or Errors in Docs

- Import paths differ between versions.

5. Suggestions for Improvement

Make Documentation Simpler & More Practical

- Show complete code files, not small fragments.

Improve Structure

- Group related topics:
 - Setup
 - Initialization
 - Authentication
 - UI Kit usage
 - Calling

Better Examples

- Provide:
 - Example of login page
 - Example of chat screen
 - Example of calling UI

Add Videos

- Short tutorials explaining:
 - Setting up the project
 - Adding extensions
 - Enabling calling
 - Managing users
